

212/497

In the claims:

1. (currently amended) A cannula for directing a liquid to or from a site during arthroscopic surgery, said cannula comprising:

a tube characterized by a distal portion and a proximal portion, said tube having a lumen extending therethrough;

a plurality of longitudinally staggered rows of slots disposed on the distal portion of the tube, wherein each row of slots comprises a plurality of slots disposed along a longitudinal line of the tube, wherein each slot is narrower in a first direction as compared to a second direction and wherein each slot is in fluid communication with the lumen of the tube;

said tube being increasingly flexible in the direction of the distal ~~end~~ portion of the tube.

2. (original) The cannula of claim 1 further comprising a plurality of circumferential ridges, said ridges disposed on the proximal portion of the tube.

3. (currently amended) The cannula of claim 1 wherein the slots are longitudinally oriented such that the first direction is a circumferential length of the slot and the second direction is a longitudinal length if the slot.

4. (currently amended) The cannula of claim 1 wherein the slots are circumferentially oriented such that the first direction is

212/497

a longitudinal length of the slot and the second direction is a circumferential length if the slot.

5. (original) The cannula of claim 1 further comprising a plurality of circumferential grooves disposed in the distal portion of the cannula, wherein at least one groove is disposed between two particular slots in a row of slots.

6. (original) The cannula of claim 5 wherein the rows of slots are longitudinally aligned with each other and wherein the at least one groove is disposed around the entire circumference of the tube.

7. (original) The cannula of claim 5 further comprising a plurality of circumferential ridges, said ridges disposed on the proximal portion of the tube.

8. (currently amended) The cannula of claim 5 wherein the slots are longitudinally oriented such that the first direction is a circumferential length of the slot and the second direction is a longitudinal length if the slot.

9. (currently amended) The cannula of claim 5 wherein the slots are circumferentially oriented such that the first direction is a longitudinal length of the slot and the second direction is a circumferential length if the slot.

10. (currently amended) The cannula of claim 5 wherein the tube is characterized by a thickness, and wherein the thickness of the tube progressively tapers along the direction of the distal end portion of the tube.

11. (currently amended) A surgical instrument port operable to allow the passage of surgical instruments into and out of a

212/497

surgical space while restricting the flow of fluid to and from the surgical space, said surgical instrument port comprising:

a rigid tube, said rigid tube having a proximal end portion and a distal end portion, said rigid tube having a lumen passing through the rigid tube, said lumen sized and dimensioned to accommodate a surgical instrument;

a valve operably connected to the rigid tube, said valve operable to allow the insertion and removal of the surgical instrument into the lumen and through the valve without allowing a substantial flow of fluid proximally through the valve;

a cannula attached to the distal portion of the rigid tube, said cannula comprising:

a flexible tube, said tube having a lumen extending therethrough, said lumen in fluid communication with the lumen of the rigid tube, wherein the diameter of the lumen is sized and dimensioned to receive a surgical instrument;

a plurality of longitudinally staggered rows of slots disposed on the distal portion of the tube, wherein each row of slots comprises a plurality of slots disposed along a longitudinal line of the tube, wherein each slot is narrower in a first direction as compared to a second direction and wherein each slot is in fluid communication with the lumen of the tube;

212/497

said tube being increasingly flexible in the direction of the distal end of the tube.

12. (original) The instrument port of claim 11 further comprising a plurality of circumferential ridges, said ridges disposed on the proximal portion of the tube.

13. (original) The instrument port of claim 11 wherein the tube of the cannula is characterized by a thickness, and wherein the thickness of the tube progressively tapers along the direction of the distal end of the tube.

14. (original) The instrument port of claim 11 wherein the valve is a duckbill valve.

15. (original) The instrument port of claim 11 wherein the cannula is removably attached to the rigid tube.

16. (original) The instrument port of claim 11 further comprising a fluid port operably attached to the rigid tube and in fluid communication with the lumen of the rigid tube.

17. (currently amended) The instrument port of claim 11 further comprising a clamp operably connected to the rigid tube, said clamp operable to restrict the flow of fluid of a ~~second~~ supply tube in fluid communication with the instrument port.

18. (currently amended) The instrument port of claim 11 wherein the slots are longitudinally oriented such that the first direction is a circumferential length of the slot and the second direction is a longitudinal length of the slot.

19. (currently amended) The instrument port of claim 11 wherein the slots are circumferentially oriented such that the first

212/497

direction is a longitudinal length of the slot and the second direction is a circumferential length if the slot.

20. (currently amended) A system for performing arthroscopic surgery, said system comprising:

a surgical instrument port operable to allow the passage of surgical instruments into and out of a surgical space while preventing the backflow of fluid from the surgical space, said surgical instrument port comprising:

a rigid tube, said rigid tube having a proximal end and a distal end, said rigid tube having a lumen passing through the rigid tube, said rigid tube sized and dimensioned to accommodate a surgical instrument;

a valve operably connected to the rigid tube, said valve operable to allow the insertion and removal of the surgical instrument through the valve without allowing a substantial flow of fluid proximally through the valve;

a cannula attached to the distal portion of the rigid tube, said cannula further comprising:

a flexible tube, said flexible tube having a lumen extending therethrough, said lumen in fluid communication with the lumen of the rigid tube and said tube sized and dimensioned to receive a surgical instrument;

a plurality of longitudinally staggered rows of slots disposed on the distal portion of the

212/497

flexible tube, wherein each row of slots comprises a plurality of slots disposed along a longitudinal line of the tube, wherein each slot is narrower in a first direction as compared to a second direction and wherein each slot is in fluid communication with the lumen of the tube;

said flexible tube being increasingly flexible along the direction of the distal end of the tube; and

a surgical instrument extending through the lumen of the rigid tube and through the lumen of the cannula, said surgical instrument operable to perform a surgical procedure.

21. (original) The system of claim 20 wherein the surgical instrument is curved.

22. (currently amended) A method of performing arthroscopic surgery, said method comprising the steps of:

providing a surgical instrument port operable to allow the passage of surgical instruments into and out of a surgical space while preventing the backflow of fluid from the surgical space, said surgical instrument port comprising:

a rigid tube, said rigid tube having a proximal end and a distal end, said rigid tube having a lumen passing through the rigid tube, said lumen sized and dimensioned to accommodate a surgical instrument;

212/497

a valve operably connected to the rigid tube, said valve operable to allow the insertion and removal of the surgical instrument through the valve without allowing a substantial flow of fluid proximally through the valve;

a cannula attached to the distal ~~portion~~ end of the rigid tube, said cannula further comprising:

a flexible tube, said tube having a lumen extending therethrough, said lumen of the flexible tube in fluid communication with the lumen of the rigid tube, wherein the diameter of the lumen of the flexible tube is sized and dimensioned to receive a surgical instrument;

a plurality of longitudinally staggered rows of slots disposed on the distal portion of the flexible tube, wherein each row of slots comprises a plurality of slots disposed along a longitudinal line of the flexible tube, wherein each slot is narrower in a first direction as compared to a second direction and wherein each slot is in fluid communication with the lumen of the tube;

said tube being increasingly flexible in the direction of the distal end of the tube; and

providing a surgical instrument suitable for performing an arthroscopic surgery procedure;

inserting the surgical instrument through the lumen in ~~the~~ a port, through the valve and through the cannula;

212/497

inserting the surgical instrument and cannula into an
operating space; and
performing the arthroscopic surgery procedure.
